

Bundle File Tool – Technical Specification

Purpose

The Bundle File Tool is a Python Tkinter-based desktop application designed to parse a specially formatted text file containing multiple embedded source code files. Each file is delineated by a marker that specifies its relative file path. The app allows users to extract and write the individual files to a user-specified output directory, preserving directory structure.

Core Features

- Read a bundle file containing multiple embedded files separated by structured markers.
- Extract files to a specified output directory while preserving the relative path.
- Tkinter GUI with File and Edit menus, as well as a setup screen for user preferences.
- Log panel and event logger with export to disk (log_dir).
- Supports repositioning of buttons and info/log panels (top, middle, bottom, or hidden).
- Prompt user to set required directories if not configured before file extraction.

GUI Overview

The application includes a main window with buttons for Open, Output, Setup, Exit, and log viewing. It includes a scrollable list of extracted file entries and an info panel showing configured paths. Users may configure default paths and UI layout using the Setup dialog.

Configuration Schema (`bundle\_config.json`)

- ``input_dir``: Default folder shown in file open dialogs.
- ``output_dir``: Default folder used when writing extracted files.
- ``log_dir``: Directory for writing runtime logs.
- ``buttons_position``: Placement of UI buttons (top or bottom).
- ``show_info_panel``: Whether to display the info panel.
- ``info_panel_position``: Location of the info panel (top, middle, bottom).
- ``relative_base_path``: Base path for resolving relative output paths during file extraction.
- ``first_launch``: Flag to show setup screen on first run.

Bundle File Parsing Logic

Each embedded file is identified using a marker in the format: ``# FILE: path/to/file.ext`` This is followed by content until the next file marker or end of file. A regex-based parser extracts each section, storing the filename and content for output.

Project Roles

- Ringo – Project Team Leader and Owner
- John – Lead Developer

- George – Lead Architect
- Paul – Assistant
